

EXTRACTION WALLS

THE SIMPLEST SOLUTION FOR COATING YOUR PRODUCTS WITH WET OR DRY SEPARATION.

TECHNICAL DESCRIPTION

In this system, parts to be coated are placed in a space in front of the extraction wall. The overspray that arises during the painting process is extracted through an extractor fan, filtered and expelled through the roof.

Depending on your requirements, MONTA can offer wet or dry separation. In wet separation, our system developed in-house is used, where the overspray is removed and filtered exceptionally well. In the dry separation version, we use high-quality filter systems by renowned German manufacturers.
